ABSTRACT

From historical and projected state population data, records of live births from 1960 to 1979, and school enrollment data for the years 1961 to 1979, projections of the school enrollments in each of Colorado's counties were developed for the years 1980 through 2000. The counties can be divided into three groups: the 22 for which complete projections can be made (at all grade levels each year); the 16 for which only partial projections can be made (at all grade levels for 1980, grades 2-12 for 1981, grades 3-12 for 1982, and so on); and the 25 for which no projections are possible. This report presents a summary of the results of the analysis, illustrated with numerous tables comparing the counties according to such measures as average annual growth and projected school enrollment for various years in the projection period. Full data on population and enrollment trends in Adams County are included as an example of the full findings of the study, but the individual reports on the rest of Colorado's counties are not included and must be obtained separately. (PGD)

SCHOOL ENROLLMENT PROJECTIONS FOR COLORADO COUNTIES TO THE YEAR 2000

Dr. Marc Swadener

School of Education

University of Colorado

Boulder, Colorado

INTRODUCTION

In December, 1978 the Regents of the University of Colorado requested a study projecting school enrollments in Colorado. The study was to project enrollments for each county and the state for each year from 1980 through 1990 and for the years 1995 and 2000. The initial report, for the state as a whole, was published in January, 1980. (9 and 10) The study then continued with the projection of school enrollments by county in Colorado. This document gives those projections. A copy of the executive summary of this report is included in full in this report.

SOURCES OF DATA

- Data used as the bases for this study were obtained as follows:
 - 1. Historical data were obtained in three primary areas.
- A. Population data were obtained from the Division of Planning of the Colorado Department of Local Affairs and the Business Research Division of the College of Business and Administration, University of Colorado. (1, 4 and 7). B. Live birth data for the years 1960 through 1979 were obtained from the Colorado Department of Health. (3) C. School enrollment data for the years 1961 through 1979 were obtained from the Colorado Department of Education and the Colorado State Library. (2)

7

2. Data on projected population for the years 1980 through 2000 were obtained from the Colorado Department of Local Affairs Division of Planning. (6) Projected population for the years between 1985 and 1990 were obtained by linear interpolation from figures for the years 1985 and 1990. Projected population data used are considered to be conservative since they have been up-dated since the analysis was done for this study.

All the historical data in 1A, 1B and 1C are contained (along with other data) in the document titled POPULATION, LIVE BIRTHS RATE AND FALL PUBLIC SCHOOL ENROLLMENTS IN COLORADO COUNTIES 1960-1979.

(8) For readers interested in these data, the above report is the only source in which population, live births and grade and total public school enrollments for all Colorado counties is included in one volume.

DEFINITION OF TERMS

There are some specialized terms which are used in this report. These are defined below.

- 1. Standard Live Birth date is the standard deviation of the deviations of the county mean live birth rate about the state mean live birth rate over the period 1960-1978.
 - 2. Live Birth Rate is the number of live births per 1000 population.
- 3. Spread Factor is the decimal equivalent of the high projection as a percent of the low projection.

PROCEDURES

Procedures used in this study were a combination of several procedures. Each procedure will be addressed separately.

For each county a live birth rate was chosen as a basis for computing the projected live births. The live birth rate was determined by the following procedure.

- A. The mean live birth rate for a county over the period 1960-1978 was used if: 1.) The county mean live birth rate over the period 1960-1978 was within one standard live birth rate (see the section titled definition of terms) of the state mean live birth rate over the same period; and 2.) if the standard deviation of the county live birth rate over the period 1960-1978 was less than or equal to one standard live birth rate. In essence the county mean live birth rate over the period 1960-1978 was used for those counties whose live birth rate over this period was stable when compared to the live birth rate of all other counties AND the state as a whole.
- B. If either or both of the two subcriteria in (A) above did not hold then the lesser of the state mean, live birth rate and the county mean live birth rate for the period 1960-1979 was used. The choice of the lesser of these two figures provided a conservative base for the projected live births, the choice of the mean provided stability.
- Once the live birth rate was chosen by the above procedure, projected live births were computed based on projected population by dividing the projected population by 1000 and multiplying this figure by the chosen live birth rate.

In this report Colorado counties are divided into three groups (see Table I). Group A counties are those for which complete projections were possible. These complete projections include all grades and total school enrollment for the years 1980-2000. Group B counties are those which only have projections for grade one through twelve in 1980, grades two through twelve in 1981, grades three through twelve in 1982, and so on through grades eleven and twelve in 1990. Group C counties are those for which no school projections were possible.

For all complete and partial projection counties, projected grade enroll ments for grades one through twelve in 1980, grades two through twelve in 1981 and so on through grades eleven and twelve in 1990 were computed in the following way. Each of the known grade level enrollments in 1979 was multiplied by a factor which represented the mean percent of students in one grade in one year entering the next grade the next year for each county for the years 1961-1979. These means were obtained from historical grade level enrollment data contained in table five of the report cited above. (8) This process resulted in projected enrollments in grades one through twelve in 1980. This same process was repeated on these projected 1980 data to obtain projected enrollments in grades two through twelve in 1981. Iterations of this process produced successive enrollment projections through grades eleven and twelve in 1990. This method of projection is called the cohort survival method and of several methods attempted in this study was the most reasonable method for this portion of the projections for counties.

For the twenty-two counties with complete projections, the remaining grade level projections were obtained by first projecting grade one enrollments for each of the years 1982 through 2000 using an equation relating grade one enrollments to population and live births. (This equation is given in the appendix for each of these thirty counties.) The equation was determined through a multivariate multiple regression procedure contained in the Statistical Package for the Social Sciences (SPSS) computer programs (11) available through the University of Colorado Computing Center. Once the grade one enrollments were obtained a procedure identical to the cohort survival procedure described above was used to "fill in" grade projections for other grades for each year, with the exception of Kindergarten enrollment in the year 2000. This figure was computed based on

projected grade one enrollment in 2000. Enrollment in Kindergarten is known to be on the average, over the past twenty years, a certain percent of enrollment in grade one in the same year for a given county. Projected grade one enrollment in the year 2000 was multiplied by the decimal equivalent of this percent to obtain projected Kindergarten enrollment in 2000.

For the twenty-two counties with complete projections, once grade level projections were obtained by the above procedure these projections were summed within years for both the "low" and the "high" projections. These sums were then corrected for enrollment in the grade level "other", based on average enrollment in this grade category for the period 1961-1979 as a percent of average total school enrollment over the same period. The above sum was multiplied by one minus the decimal equivalent of this percent to obtain projected total school enrollment. Projected enrollment in grade "other" was then obtained by subtracting from the projected total school enrollment the sum of the projected enrollment in grades Kindergarten through twelve.

The choice of placing each county in either the complete or partial projection category was a two step procedure. The first step included four criteria.

- 1. The value of the multiple correlation in the multiple regression for grade one must have been greater than .63 (i.e. the R squared greater than .4).
- 2. The ratio of the "spread factor" for total school enrollment for the year 2000 to the spread factor for population for the year 2000 must have been less than 1.3. This means that the spread of the high and low projected total school enrollments for the year 2000 could not be significantly different from the spread in projected population in the year. 2000.

- 3. The ratio of projected enrollment to projected population for given years/grade levels must have been between .7 and 1.3 times the corresponding ratio for 1979.
- 4. All projections must have been positive. As a Mote of interest, due to erratic historical trends applying the multiple regression equation for grade one projections for six counties resulted in some negative entries later in the 1980-2000 period. These six counties were excluded from complete projections for this reason.

These four criteria were applied to each county as a "first cut" criteria. All four of these criteria had to apply for a given county in order to even consider including complete projections for a county. The result of this was that thirty counties were considered for complete projections, thirty three were considered for partial projections.

At this point in the analysis there were three groupings of counties. Complete projection counties, partial projection counties, and one-no school projection county, Hinsdale County, which does not have a secondary school.

A second round criteria was then applied to all but Hinsdale County. For each county the percent growth in total school enrollment and/or grade twelve enrollment over the period 1979-2000 or 1979-1990 was computed, yielding either four or two numbers depending on whether the county was at that point a complete projection or a partial projection county. From each of these percents was subtracted the appropriate percent growth in population for that county. This difference was then compared with a corresponding figure for the state of Colorado as a whole to check for reasonableness of the projections. This procedure indicated that eight of the then complete projection counties were misplaced -- four were placed in the partial

projection category and four were felt to be sufficiently outrageous to warrant making no school projections. Also of the thirty-three, then partial projections, twelve were felt to be reasonable and were retained as partial projection counties and twenty-one were felt to be unsuitable for school projections as completed in this study.

The end result is that there are twenty-two counties with complete projections in this report, sixteen counties with partial projections in this report, and twenty-five counties with no school*projections in this report. Please note however that in the comprehensive report of this study all counties have projections of population, live births and live birth rate (as chosen by the above procedure.)

Projected number of teacher and non-teacher personnel needed to support the projected total school enrollments were computed by multiplying projected total school enrollments by the decimal equivalent of the ratio of teachers to students and non-teacher certified personnel to students (29675 to 550,527 and 5206 to 550,527 respectively) for the state of Colorado as a whole in 1979.

ASSUMPTIONS

All research is based on certain assumptions. For this study several assumptions have been made.

1. It is assumed that historical trends established over the past twenty years in Colorado and Colorado counties will continue in the future. This assumption, in the case of some counties, is tenuous but it is virtually impossible to tailor the procedures used to the unique situation in each county. The counties which at the present time appear to not fit this assumption are those counties that will be impacted by the development of the energy industry. For those counties, suitable adjustment of the projections given in this report, made on the basis of specific information,

is warranted but is beyond the scope of this study. However, to some degree these factors are accounted for in the projections of population as used in this study.

- 2. It is assumed that the population projections used in this study, as published by the Colorado Department of Local Affairs, Division of Planning (6), are the best such projections available.
- 3. Due to the erratic nature of live births and live birth rate for many counties over the past twenty years, it is assumed that a fixed (as chosen) live birth rate for the next twenty years is the best basis for projecting live births.

RESULTS

In this report the following information is given: a) For each of the twenty-two counties for which complete projections were possible, this report includes four tables of results. These tables include "low" and "high" projections. The "low" and "high" figures represent an interval within which there is a 50-50 expectation that the actual figures will fall. The tables include projections for population, live births, live birth rate, grade level enrollments, total school enrollments, and teacher and non-teacher certified personnel needed to support these enrollments. In addition, for each of these counties, the formulas used to arrive at the school enrollment projections are given.

b) For the sixteen counties for which partial projections are made, three tables for partial grade level enrollment projections are given. These partial projections include low and high projections for population, live births, live birth rate and some grade levels. The grade levels included are those for successive grades based on known 1979 enrollments. Thus for these sixteen counties only grade enrollments above "the diagonal" are given.

14

All other entries in the school enrollment table are given as (-0) to indicate that projections in these areas were not possible with any reasonable degree of certainty, given the procedures used. The equations used to make the successive grade enrollment projections for these counties are also given.

- c) For counties with no school projections, data on projected population, live births, and live birth rate for 1980-2000 are included. Even though no school projections were possible for these counties it is felt that the data given will assist local officials in making decisions for the future. These data make this report more complete than if this information were deleted.
- d) Given the massive amount of data generated by this study and to avoid delay, no attempt was made at this time to identify patterns across counties or county groupings. However the scope of coverage of counties in Colorado can be measured by considering the percent of Colorado population which is included in the complete projection counties and the partial projection counties. The twenty-two complete projection counties account for 75.8 percent of Colorado population in 1979, and approximately 74.5 percent in both 1990 and 2000. Partial projection counties account for 17.5 percent of Colorado population in 1979 and about 18.3 percent in 1990. Thus these two groupings of Colorado counties combined account for 93.4 percent of Colorado population and about 93 percent in 1990. Thus it is clear that by far the major portion of Colorado population centers are included in this report in either a complete or a partial projection county.

On the attached pages the complete executive summary and results for each county (in alphabetical order) are given. Where it was felt that some commentary on the results for a county would be of assistance, such commentary is given.

EXECUTIVE SUMMARY

Conclusions

- 1. Over the period 1980-1990 Colorado counties will experience a slight decrease in the proportion of their populations which will be in the grade twelve age group and experience slow growth in numbers of students over the same period.
- 2. This trend indicates that the pool of grade twelve students available for enrolling in post high school educational institutions will remain relatively constant over the period 1980-1990, and that the pool of potential "older" students for these institutions will increase during the period.
- 3. The trend for slow growth in public school grade twelve enrollment over the period 1980-1990 will change to greater growth in the period 1990-2000. This will be reflected in greater demands on post high, school educational institutions during the 1990-2000 period than during the 1980-1990 period. This change in a positive direction will begin in the late 1980's.
- 4. Overall, Colorado counties will experience significant growth in population and a slightly lesser growth in public school enrollment over the period 1980-1990 with a gain in growth in public school enrollment during the period 1990-2000. However, there are some counties which can expect decreases in both population and public school enrollment over both periods. There are also a number of counties which can expect vigorous growth over the same periods in both population and public school enrollment.

- 5. It is projected that the population of Colorado counties, on the average, will be growing at a more rapid rate than the United States as a whole.
- 6. With respect to the "low population projections" seven of the counties in the eastern portion of the south central part of the state constitute the largest concentration of counties which are projected to have negative growth over the next twenty years. Nine other counties will experience negative growth; Park, Clear Creek, Gilpen, Jackson, Washington, Sedgwich, Dolores, Ouray, and Denver. All these counties with projected negative growth comprised 24.5 percent of the state population in 1979, are projected on a low projection bases to comprise 19.4 percent in 1990 and 16.2 percent in 2000.
- 7. All counties <u>not</u> included in statement number six will experience positive growth in population and in general a slightly less positive growth in school enrollment.
- 8. The projections for partial projection counties, based solely on the cohort survival procedure, are considered very conservative or lower than can be expected to actually take place.
- NOTE: Population and projections for complete projection counties within this report are given in terms of "low" and "high" projections.

 These low and high projections represent a fifty percent confidence interval. That is, there is a 50-50 chance that the actual population/enrollment will fall within the interval between the low and high projection.

In December, 1978 this study was undertaken at the request of the Regents of the University of Colorado. The purpose of the study was to project school enrollments in Colorado and Colorado counties to the year 2000. The study has been completed in two phases. The first phase projected school enrollments for Colorado as a whole and resulted in two reports issued in January and August of 1980 (1 and 2). The study then continued into the second phase, projecting enrollments for Colorado counties. This report summarizes the results of the second phase. Persons interested in details of this second phase are directed to two other reports; one containing historical data (3) and the other containing the comprehensive report on counties, which contains an extensive series of tables encompassing each county in Colorado (4).

This report concerns projections of school enrollments in public schools during the fall of the school year. It does not concern enrollment in private or parochial schools. Suitable connections should be made if these schools are to be included for planning purposes. In Colorado as a whole, enrollment in private and parochial schools is about eleven percent of enrollment in public schools.

For the purposes of this report, Colorado counties are divided into three groups: twenty-two counties with complete school projections, sixteen counties with partial school projections, and twenty-five counties with no school projections (see Table I). The criteria for placing each county into one of these three categories are given in the comprehensive report of this study.

For "complete projection" counties, this study projects grade level and total school enrollments for the complete period 1980-2000. For "partial

projection" counties only successive grade level projections beginning with grades one through twelve in 1980, grades two through twelve in 1981 and so on through grades eleven and twelve in 1990 are included. For "no-school projection" counties only projections for population, live births and live birth rate are included.

Projections in this study were completed using a three part procedure. Live birth rates were projected using multiple criteria, based on historical trends over the period 1960-1979. Partial projections were completed using the cohort survival method of projection. Cohort survival multipliers were determined by averaging grade to grade successor multipliers from historical grade enrollment data for each county over the period 1961-1979. These were then applied in iterations on known enrollment figures for 1979.

Complete projections were made by determining an equation relating grade one enrollment, population during the year of birth and live births the year of birth. This equation was applied to population, projected population and projected live births to obtain projected grade one enrollments for each complete projection county for the years 1981-2000. Cohort survival multipliers were then applied to "fill in" all other grade levels. Total school enrollments were obtained by summing grade level enrollments and correcting this sum for non-graded enrollments (as reflected in historical data for each county).

An exhaustive list of tables giving the projections resulting from this procedure, along with complete appendices on the equations used, etc., is presented in the comprehensive report of this study. Data for 1979 and projected data for 1990 and 2000 are given in this report in Tables II through IV. These data were given additional analysis to extract projected

growth rates, percents, means and standard deviations for all counties and the three categories of counties, where applicable. These data are presented in Tables V through XV in this report.

Further extraction of the county data along with corresponding data for the United States and Colorado as a whole are given for comparison in Tables I-A and I-B in this report.

<u>Digest of Results</u>

- Complete projection counties represent three-fourths of the population of the state of Colorado consistently throughout the 1979-2000 period.
- 2. Complete projection and partial projection counties combined represent nearly ninety-three percent of the population of Colorado consistently over the period 1979-2000.
- 3. Complete projection counties represent a proportion of total public school enrollment of the state of Colorado consistent with their population.
- 4. The mean annual growth rate in population for all counties in Colorado will be between 1.66 percent and 3.76 percent for the period 1979-1990 and between 1.53 percent and 2.75 percent for the period 1979-2000.
- 5. Complete projection counties will experience an average of between 1.96 percent and 2.87 percent annual growth in population over the period 1979-2000.
- 6. Partial projection counties will experience an average of between 1.88 and 3.85 percent annual growth in population over the period 1979-1990.
- 7. No school projection counties will experience an average of between 1.18 and 3.79 percent annual growth in population over the period

- 1979-1990 and between 0.99 and 2.56 percent annual growth over the period 1979-2000.
- 8. Complete projection counties will experience an average annual growth of between 1.95 and 2.68 percent in public school enrollment over the period 1979-2000, and between 1.44 and 2.32 percent average annual growth in public school grade twelve enrollment over the same period.
- 9. Partial projection countiés will experience very little if any growth in public school grade twelve enrollment over the period 1979-1990. The projections for partial projection counties are to be considered very conservative or lower than what will actually take place. This is attributable to the cohort survival method used.
- 10. On the average, public school enrollment as a percent of population for complete projection counties in the year 2000 will be nearly the same as it was in 1979, about 21.4 percent.
- 11. On the average, public school grade twelve enrollment as a percent of population for partial projection counties will change from 1.58 percent in 1979 to between 1.08 and 1.31 percent in 1990. This reflects a slight decrease in the pool of potential seventeen/eighteen year olds available for college enrollment from these counties in relation to the population as a whole.
- 12. The same trend appears to be applicable for complete projection counties from 1979 to 2000 except that the decrease will be less pronounced; a change of from 1.63 percent in 1979 to about 1.5 percent in 2000.

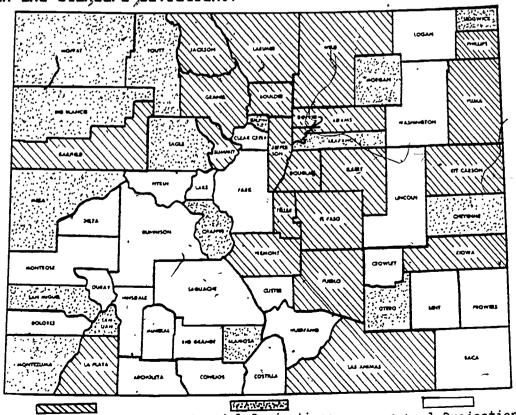

Companion Reports of Projections/

This phase of this study has generated several other reports: a one volume comprehensive report of projections including a complete set of tables and commentary for each county, and thirty eight individual county reports—one for each county in the complete projection and partial projection categories. Separate county reports are not available for the twenty—five counties for which no school projections were possible (see Table I).

TABLE I. Numbered alphabetical list of Colorado counties. Those counties with only partial projections in this study are marked with a single asterisk (*), counties with no school projections are marked with a double asterisk (**), all others have complete projections.

(Note: Data for the state of Colorado in the following tables are included only for reference purposes. Thus entries for the state of Colorado in each of the following tables were deleted from calculation of the mean and standard deviation.)

Complete Projections

Partial Projections. No School Projections

TABLE'I-A. Summary data for projected average annual growth rates for populations for the United States, Colorado and catagories of Colorado counties. The LOW and HISH columns contain rates (in percent) computed from low projections and high projections of populations, thus in some cases the HISH entry may be less than the LOW entry.

Cases the HIRH autha was be less	than, the Lum	witry.	γ

APPENDIX

Results for each county in Colorado

1. ADAMS COUNTY

Tables 1-1 through 1-4 present projections for Adams county for the period 1980-2000.

The population of Adams county is projected to change from 234,800 in 1979 to between 367,800 and 418,100 in the year 2000. This represents a change of between 56.64 and 78.07 percent over the period for an average compound annual growth rate of between 2.16 and 2.79 percent. By comparison, the population of Colorado as a whole is projected to grow from 2,716,000 in 1979 to between 3,979,579 and 4,731,733 in the year 2000 (10), a change of between 46.52 and 74.22 percent or between 1.84 and 2.68 percent average annual growth over the period 1979-2000. Also by comparison, the mean average annual growth in population for all sixty-three counties in Colorado is projected to be between 1.53 and 2.75 percent annually.

The live birth rate for Adams county is projected to be on the average 18.8 per thousand population per year over the period 1980-2000. This figure is less than the mean live birth rate for Adams county over the past twenty years of 21.5 births per thousand per year.

Total public school enrollment in Adams county over the period 1979-2000 is projected to change from 48,223 in 1979 to between 63,865 and 69,577 in the year 2000. This represents a change of between 32.44 and 44.28 percent over the period for an average compound annual growth rate of between 1.35 and 1.76 percent. Projection of total public school enrollment for the state as a whole indicates a growth in enrollment of from 550,527 in 1979 to between 703,703 and 829,724 in the year 2000(10). This represents growth of between 27.71 and 50.71 percent over the 1979-2000 period or an average annual growth rate of between 1.17 and 1.97 percent.

For Adams county, total public school enrollment in 1979 was 20.54 percent of population. In the year 2000 it is projected that total public school enrollment in Adams county will be between 16.84 and 17.36 percent of population. For the state as a whole, in 1979, total public school enrollment was 20.27 percent of population and it is projected that in the year 2000 this figure will between 17.54 and 17.67 percent.

Public school grade twelve enrollment in Adams county is projected to change from 3,635 in 1979 to between 3,764 and 4,057 in the year 2000. This projection represents a change in public school grade twelve enrollment over the period 1979-2000 of between 3.55 and 11.61 percent for an average annual growth rate in public school grade twelve enrollment of between 0.17 and 0.52 percent. For the state as a whole, public school grade twelve enrollment is projected to change from 40,939 in 1979 to between 43,438 and 51,260 in 2000(10). In percentage terms this represents a change of between 6.1 and 25.21 percent over the period or an average compound annual growth rate for public school grade twelve enrollment of between 0.28 and 1.08 percent.

Public school grade twelve enrollment in Adams county in 1979 was 1.55 percent of population. This figure is projected to change to between 0.97 and 1.02 percent of population in the year 2000. While on a statewide basis, public school grade twelve enrollment in 1979 was 1.51 percent of population andmis projected to be about 1.08 percent in the year 2000.

Presuming that the ratio of teachers to pupils and the ratio of non-teacher certified personnel to pupils will remain relatively constant, the number' of teachers and non-teacher certified personnel needed to support projected enrollments will change proportionally with the change in enrollment.

It is impossible to project where, within a county, change in the population or school enrollments will occur. Each county has unique growth patterns within that county which are dependent on many social and economic factors. Identification of these factors and their effect on growth patterns within a county are not a part of this study.

Growth in grade twelve inrollments in Adam's county. positive over the period 1980-2000, will be less than growth as a whole. Over this period, public school enrollment as a percent of population will decrease about three This indicates a population in the county percentage points. which will be slightly older than at present. This could mean a greater proportion_of wage earners than in the past and a greater need for adult education/recreation programs. This also reflects the trend in the county over the past twenty years, and closely parallels trends for the state and the nation.

ADAMS COUNTY, COLORADO

1 ADAMS COUNTY, COLORADO

******* FORMULA FOR THE PROJECTION OF GRADE ONE ENROLLMENTS GIVEN IN TABLE 2.

```
GRADE ONE ENROLLMENT = ( -.00292300) TIMES THE POPULATION DURING THE YEAR OF ENROLLMENT
+( .97885984) TIMES THE NUMBER OF LIVE BIRTHS DURING THE YEAR OF BIRTH
+( -.00202241) TIMES THE POPULATION DURING THE YEAR OF BIRTH
+( 1295.)

R SQUARED = .81182 F = 12.94208 SIGNIFICANCE = .001 N = 13
```

FORMULAS FOR THE SUCCESSIVE GRADE LEVEL ENROLLMENTS

ENROLLMENT IN GRADE 1 = (1.0587) TIMES ENROLLMENT IN KINDERGARTEN THE YEAR BEFORE

ENROLLMENT IN GRADE 2 = (.9728) TIMES ENROLLMENT IN GRADE 1 THE YEAR BEFORE

ENROLLMENT IN GRADE 3 = (.9951) TIMES ENROLLMENT IN GRADE 2 THE YEAR BEFORE

ENROLLMENT IN GRADE 4 = (1.0059) TIMES ENROLLMENT IN GRADE 3 THE YEAR BEFORE

ENROLLMENT IN GRADE 5 = (.9954) TIMES ENROLLMENT IN GRADE 4 THE YEAR BEFORE

ENROLLMENT IN GRADE 6 = (1.0187) TIMES ENROLLMENT IN GRADE 5 THE YEAR BEFORE

ENROLLMENT IN GRADE 7 = (1.0449) TIMES ENROLLMENT IN GRADE 6 THE YEAR BEFORE

ENROLLMENT IN GRADE 8 = (.9967) TIMES ENROLLMENT IN GRADE 7 THE YEAR BEFORE

ENROLLMENT IN GRADE 9 = (.9998) TIMES ENROLLMENT IN GRADE 8 THE YEAR BEFORE

ENROLLMENT IN GRADE 10 = (.9887) TIMES ENROLLMENT IN GRADE 8 THE YEAR BEFORE

ENROLLMENT IN GRADE 11 = (.9417) TIMES ENROLLMENT IN GRADE 9 THE YEAR BEFORE

ENROLLMENT IN GRADE 12 = (.8949) TIMES ENROLLMENT IN GRADE 10 THE YEAR BEFORE

ENROLLMENT IN KINDERGARTEN IN THE YEAR 2000 = THE ENROLLMENT IN GRADE 1 THAT SAME YEAR DIVIDED BY (1.4513)

TOTAL SCHOOL ENROLLMENT = THE SUM OF ENROLLMENTS IN GRADES K THROUGH 12 DIVIDED BY (.9748)

ADAMS COUNTY, COLORADO

Pages 25-328 have been removed; they contain projections for the remaining Colorado counties.
